

GAMERNATION COMPANY

GamerNation, a dominant online gaming platform boasting millions of users, experiences a devastating ransomware attack. Hackers infiltrate their servers by Phishing attack, encrypting player data including login credentials, payment information, and potentially even in-game purchases.

CASE
STUDY

POLICY

Data Security Policy

Employee Training Policy

the company must to protecting its data assets and it establishes guidelines and procedures for handling, storing, and transmitting data in a secure manner.

providing employees with the necessary knowledge and skills to protect sensitive data, comply with company security policies, and identify and report potential security threats.

STANDARD: ROBUST ACCESS CONTROL:

secure employee access as defense for protection data.

PROCEDURES

- **Enforce strong password**
- **Implement multi-factor authentication (MFA) for all employee accounts**
- **authorize and Implement the principle of least privilege for employee and system access.**

GUIDELINES

strong password with a minimum length of 12 characters, including a mix of uppercase, lowercase, numbers, and special characters.

standard: Security Awareness Training:
Standardizing security awareness training for employees.

PROCEDURES

- **The Board of Directors determines training for employees about cyber attacks based on reports sent by the Cyber Security Department**
- **Send an email with all training details to employees**
- **Holding training at the company's headquarters**
- **Evaluating training outcomes by testing employees**

Risk Management									
Scenario	Likelihood	Impact (Before)	Risk Before	Control	Cost	Likelihood (Post-Control)	Risk After	Risk Reduction	Strategy
Phishing attack compromises employee credentials	30%	High (Data breach, service disruption)	\$175,000	Implement security awareness training & MFA	\$200,000	10%	\$50,000	\$125,000	Reduce
Unpatched server vulnerability exploited	20%	High(Complete system shutdown)	\$150,000	Enforce regular vulnerability scanning & patching	\$150,000	5%	\$30,000	\$120,000	Reduce
Outdated backup system hinders data recovery	40%	Moderate (Data loss, downtime)	\$160,000	Implement regular data backups & test recovery procedures	\$100,000	20%	\$40,000	\$160,000	Reduce

INCIDENT RESPONSE

PLAN

Verifying the extent of employees' knowledge about phishing by conducting awareness training. Ensuring the integrity of anti-virus and intrusion detection systems and that they are working perfectly.

DETECTION

- Alarm via intrusion detection systems and firewall review
- security team would monitor employee activities and login attempts.

REACTION

- notify the security team
- take the network offline
- unplug affected devices from the network

DISASTER RECOVERY

PLANNING

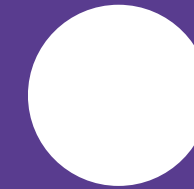

Verify the integrity of recent backups before the attack to ensure they haven't been compromised.

Establish a secure and automated data backup strategy that regularly replicates critical information to secure cloud storage.

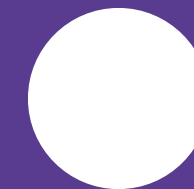

Test data backups regularly to ensure recoverability and identify any potential issues.

RECOVERY OPERATIONS

restoring affected servers and infrastructure, potentially involving reinstalling operating systems and applications.

Isolate infected systems since promptly disconnect compromised servers and systems from the network to halt the ransomware's spread.

- **move to the hot site**

BUSINESS CONTINUITY PLANNING
